

VoteHubPH

Full-Stack Web App

PROJECT TYPE Full-Stack Web App	PLATFORM Full-stack responsive web application
AUDIENCE Filipino voters, candidates, and moderators	PRIMARY FOCUS Election information and civic participation

Overview

A comprehensive voting platform designed to empower Filipino citizens with transparent candidate information, community insights, and real-time engagement across all levels of Philippine government. Features location-based filtering, community engagement, and admin moderation.

Core Features

- Candidate Profiles across all government levels
- Location-Based Filtering (Region, Province, City, Barangay)
- Community Engagement with voting and comments
- Secure Authentication (Google OAuth, Email OTP)
- User Post Submission for community review
- Admin Moderation for content approval
- Party List Directory with member listings
- Real-time Updates and notifications

Experience and Design

- Candidate directories cover national, local, and barangay government positions.
- Location filters narrow information by region, province, city, and barangay.
- Profiles, party-list pages, community posts, comments, and voting support public discovery.
- Moderation workflows review user submissions before information becomes publicly visible.

Architecture and Data

- Next.js and TypeScript provide the public interface, dashboards, and interactive filtering.
- Laravel exposes application services for candidate, community, and moderation workflows.
- PostgreSQL stores structured election, location, account, and engagement records.
- Prisma and validated API contracts keep frontend data access predictable and typed.

Security and Privacy

- Google OAuth and email one-time passwords provide controlled account access.
- Role checks separate ordinary users from content moderators and administrators.
- Server-side validation protects candidate, post, comment, and location submissions.
- Moderation states prevent unreviewed public content from bypassing approval workflows.

Technology Stack

Next.js 14	Application framework and UI
TypeScript	Application language
Laravel 11	Backend application services
PostgreSQL	Authentication, database, or cloud data
Tailwind CSS	Interface styling and design system
Prisma	Database access and schema management

Performance and Reliability

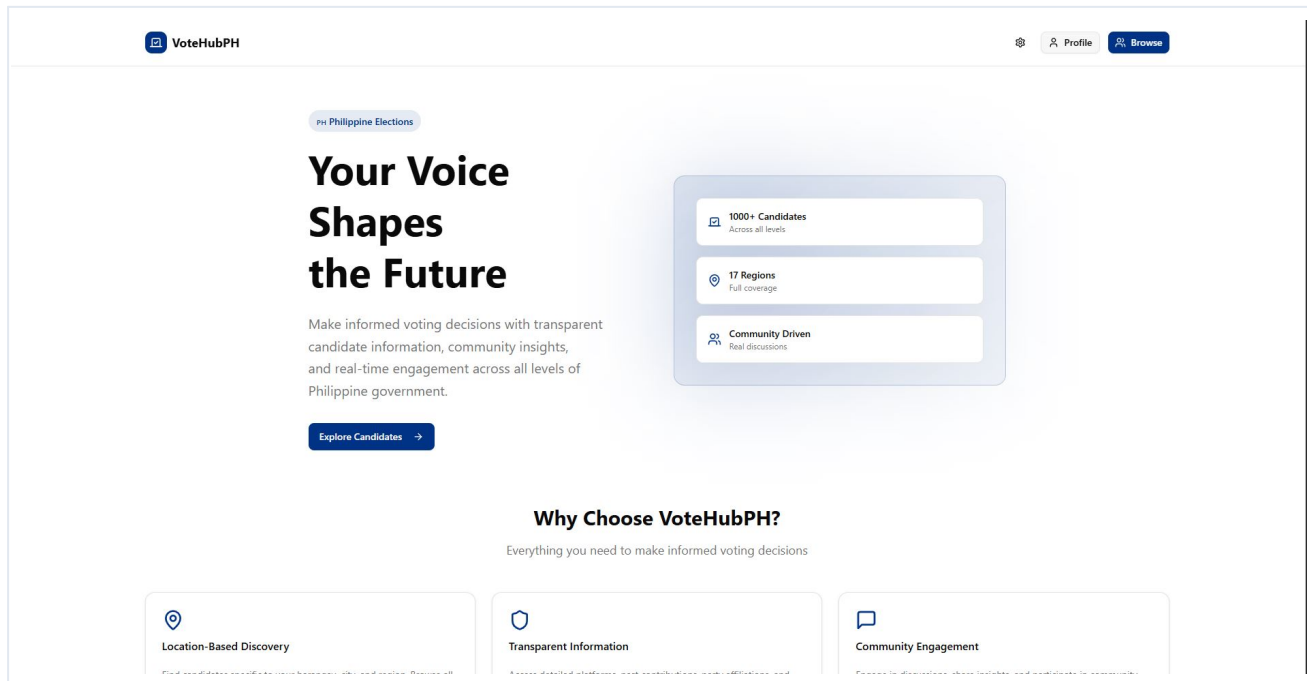

- Server rendering improves first-load visibility for public election content.
- Location and candidate indexes support hierarchical filtering at scale.
- Paginated directories keep candidate and community pages manageable.
- Optimized media delivery reduces the cost of profile and party-list imagery.

Platform Requirements

- Current desktop or mobile browser with JavaScript enabled.
- Internet connection for live candidate, election, and community information.
- Google account or email access when authentication is required.
- Location selection is needed for the most relevant local-government results.
